

## Water management system for replacement trees & vines in high value horticulture

**H2Ortigator** accumulates ~15L water in under 4 minutes when the orchard's irrigation system is turned on. Once the irrigation finishes, **H2Ortigator** begins to deliver an ultra low volume of water (less than a cup an hour) directly to the rootball of the replacement for up to an **additional 3 days**. Water remains in the soil around the young plant's small rootzone providing ideal soil moisture conditions for **establishment** and **growth**. Add into the equation **H2Ortigator** encircles the tree, **suppressing competitive weed growth**, **shading** the soil and rootzone, **minimising evaporation** and offering **physical protection** from horticultural sprays, rabbits, and machinery damage.

**The result is low replacement death and significant increases in growth and earlier returns**
